

WebCAMP Data Dictionary

[Close](#)

General Notes

The WebCAMP database consists of a set of active tables sharing certain common characteristics and a few fields that are common to all tables. In addition to the active tables, a database that has the WebCAMP audit trail turned on (or has EVER had it turned on) will contain an additional set of tables, the audit trail tables. There is one audit trail table for each active table, and an audit trail table's name always begins with a lower-case "x". The "x" is followed by the name of the corresponding active table with the final letter of the table name dropped, as in the following example:

Active table ACTIVITY => Audit trail table xACTIVIT

Each audit trail table will contain all the same fields, with the same datatypes, as the corresponding parent table, except that the UNIQUEFIELD in the audit trail table will have a datatype of LONG and will not be specified as a unique primary key (there is no primary key in an audit trail table). This allows multiple versions of the same record to be written to the audit trail table when the record has been modified multiple times. In addition, each audit trail table contains the following special fields:

- **USR_WHODELETED:** If the current record has been deleted, this field references the user who was logged in when the deletion occurred. (Note that some deletions are not direct, but occur as "side-effects" of other deletions, such as in a cascading delete operation.)
- **DELETEDATE:** If the current record has been deleted, the date it was deleted
- **DELETEPAGE:** If the current record has been deleted, the value of CurrentPage at the time the record was deleted.
- **DELETECALLINGPAGE:** If the current record has been deleted, the value of CGIREFERER at the time the record was deleted.

If a record has not been deleted, the most recent version of the record will always reside in the active version of the table. All past versions (if any) will reside in the corresponding audit trail table. Thus, the combination of the active table and the corresponding audit trail table will always contain the complete history of versions to an active record. When a record is deleted, the latest version of the record is written to the audit trail table (with appropriate information provided in the above fields) and the record is completely removed from the active table. Please see the table and field descriptions below (viewable by clicking on a table name or field name) and the document "Programming Standards for WebCAMP.doc" (available in the SourceCode/Documentation subfolder) for more detailed information.

The following list includes all active tables and their fields. The structures of an audit trail table, if present, can be gleaned from the above information and the structure of the corresponding active table.
